

# IBA XM-3

Iron Brigade Armory, under contract to the Defense Advanced Research Projects Agency [DARPA], developed and built the XM-3 to incorporate the best available technology into a sniper weapon system that addresses current operational concerns on size, weight, target detection, sound suppression, accuracy, range, day/night operations and the use of titanium. The XM-3 has established the baseline from which DARPA will identify investment areas where new technologies are needed to provide snipers and riflemen the greatest possible advantage on tomorrow's battlefield.
